

5CFitnessPal

The ultimate fitness, predominately macro tracking, app for the 5C student

PMs:

Andrew Zheng PO '29 (CS)

Jay Li PO '29 (Math and CS)

Overview:

Calories, protein, carbohydrates, fats, and fiber (among other macronutrients) are all crucial information for anyone to hit their health & fitness goals, whether it be weight loss, muscle gain, or athletic performance.

For college students with such goals, it is incredibly difficult to track macronutrient intake at dining halls. At home, existing apps like MyFitnessPal or MacroFactor make tracking

macronutrients very easy; simply look at the nutrition label of your food. But in the dining halls, we lack such tools.

5CFitnessPal solves this gap. Every day, we scrape the 5C menu websites (the same method 5CMenu uses) and display macronutrient information for available meals, so students and faculty can track exactly what they're eating. It's especially valuable now, as Gen Z grows increasingly health- and fitness-oriented. Additionally, colleges students live in a closed food system for the most part, meaning that college students really are only consistently eating the college foods, so tracking becomes even easier.

Prototype using a Frank Dining Hall menu from Spring 2026:

<https://5-c-nutrition-pal.vercel.app/dashboard>

Sources for macronutrient data:

Collins: <https://collins-cmc.cafebonappetit.com/cafe/collins/>

Frank: <https://www.pomona.edu/administration/dining/menus/frank>

Frery: <https://www.pomona.edu/administration/dining/menus/frary>

Hoch: <https://hmc.sodexomyway.com/en-us/locations/hoch-shanahan-dining-commons>

Mallott: <https://scripps.cafebonappetit.com/>

McConnell: <https://pitzer.cafebonappetit.com/>

- Collins, mallott, and mcconnell use the same website: cafebonappetit.com
- Frank & Frary have their own website and so does Hoch. As a result, must be unique datascraping solutions for these three sources.

Goals

Our primary goal is to build a fully-functional, full-stack mobile application — not just the web prototype we used for the presentation — that lets 5C students and faculty track macronutrient intake directly from daily dining hall menus. By the end of the semester, we want a polished, App Store-ready iOS app (built in Swift/XCode) backed by a Supabase database and daily-updating scrapers across all six dining halls, so users can log meals, track progress toward calorie and macro goals, and actually rely on the tool day-to-day — taking the project from a working prototype to a real, usable product for the 5C community. We want this to genuinely be a product for our 5C community here in Claremont.

Tech Stack

- Python (webscraping)
- Javascript
- HTML/CSS
- Swift/XCode
- Supabase
- Vercel Web Hosting
- LLM API

Member Recruitment:

We are looking for **2 front-end engineers** and **1–2 back-end engineers**. We expect the team to put in 3–5 hours a week each.

Front-End Engineers (2)

You'll build the user-facing app — the home page, search/filter page, macros tracking dashboard, and the "add meal" flow — and later help convert the web build into a native iOS app.

- Comfortable with JavaScript and HTML/CSS; React or similar framework experience is a plus
- Willingness to learn Swift/XCode later in the semester (Week 7) to port the app to iOS — no prior Swift experience required
- An intuition for clean, intuitive UI design

Back-End Engineers (1–2)

You'll build and maintain the data pipeline that powers the whole app — scraping menu data from the 5C dining hall websites, storing it, and connecting it to the frontend.

- Familiarity with Python, since our scraping mechanisms are built in Python
- Basic understanding of databases (we use Supabase); prior experience with Supabase/Postgres/Firebase is a plus but not required
- Comfortable working with APIs (we integrate an LLM API and pull from multiple external menu sources, each with different formats)

- Interest in web scraping specifically, since Frank, Frary, and Hoch each require unique scraping solutions

Timeline

	Frontend	Backend
Week 1	Administrative stuff + Introductions + splitting workload	
Week 2	Rough mock up of UI workflow: home page + search page + macros page	Create the web scraping mechanism for each menu (mallott, collins, frank etc.)
Week 3	Finalize home page design and functionality	Design daily updating mechanism
Week 4	Finalize “add meal” design and functionality	Create login workflow in Supabase + coordinate with ITS for 5C credentials login
Week 5	Build out the search/filter page and macros tracking page functionality (logging meals, daily totals, progress toward goals)	Integrate scraped menu data with the database + connect macros to the frontend display
Week 6	Polish UI, add "add meal" account for edge cases; internal testing	Testing & debugging the daily-updating scraper for all 6 dining halls
Week 7	Convert JS/HTML/CSS code to Swift/XCode to get the app on the App Store	
Week 8	Finalize backend-frontend connections with login mechanism + UI	Finalize backend-frontend connections with login mechanism + UI
Week 9	User testing
